Data cleaning

ramen-ratings.csv had missing/invalid data.

Missing/Weird Package

ID	Country	Brand	Type	Package	Rating
2167	CHN	Brand G	E Menm Chicken	NaN	3.8
2351	JPN	Brand D	Chicken Instant Noodle	NaN	4.8
2352	JPN	Brand E	Mushroom Instant Noodle	NaN	4.5
2353	THA	Brand F	Beef and Mushroom Instant Noodle	NaN	2
2354	USA	Brand G	Kimchi Ramen	NaN	4
2355	JPN	Brand A	Shoyu Ramen	NaN	4.5
2356	KOR	Brand B	Shoyu Ramen	NaN	1.8
2457	TWN	Brand C	100 Furong Shrimp	NaN	3

Review 2167, 2351-2356, 2457 are missing data in the Package column. I try to extrapolate from previous data.

Ideally, if the Country, Brand and Type matches, I would be able accurately extrapolate the missing Package. However, for each review missing Package, there was no other review that matched its Country, Brand and Type.

I decided that if the Brand and Type is the same, the package should probably be the same.

ID	Country	Brand	Type	Package	Rating
1268	CHN	Brand A	Shoyu Ramen	Pack	3
2355	JPN	Brand A	Shoyu Ramen	NaN	4.5
2441	USA	Brand A	Shoyu Ramen	Cup	1.8
2455	THA	Brand A	Shoyu Ramen	Pack	5
2481	KOR	Brand A	Shoyu Ramen	Pack	2.9
2508	THA	Brand A	Shoyu Ramen	Pack	2.8
2561	USA	Brand A	Shoyu Ramen	Pack	2
2601	USA	Brand A	Shoyu Ramen	Pack	2

For example, most review that had "Brand A" and "Shoyu Ramen" were of "Pack" so I extrapolate that the Package for review 2355 is "Pack". For the reviews with missing Package, I extrapolate if confidence level is >80%. I could do so for 5/8 reviews that were missing Package. I also tried matching Country and Brand, and just Brand, but could not get >80% confidence so I still have 3 reviews with missing Package.

Review 82 has Package "Can" and Review 1440 has Package "Bar", which each occur once and does not seem like an applicable unit for ramen. I tried the above extrapolation but was not successful, so I left them as Can and Bar.

Missing Type

Reviews 2482-2494,2595-2606 are missing data in the Type column
I tried to extrapolate the Type for reviews missing Type, but was not successful because Type is not repeated much across the dataset.

Missing Rating

Reviews 47,137,1008 have "#VALUE!" in the Rating column. Reviews 2430-2435,2595-2606 are missing data in the Rating column.
Lastly, I decided to remove all reviews that have missing/invalid rating, because this is supposed to be a ramen ratings database, the review is meaningless without a proper rating.

Result from cleaning

RangeIndex: 2615 entries, 0				Int64Index: 2595 entries, 0			
Data columns (total 6 columns)				Data columns (total 6 columns)			
#	Column	Non-Null Count		#	Column	Non-Null Count	
---	-----	-----		---	-----	-----	
0	ID	2615 non-null		0	ID	2595 non-null	
1	Country	2615 non-null		1	Country	2595 non-null	
2	Brand	2615 non-null		2	Brand	2595 non-null	
3	Type	2591 non-null		3	Type	2582 non-null	
4	Package	2607 non-null		4	Package	2592 non-null	
5	Rating	2598 non-null		5	Rating	2595 non-null	

Because I dropped reviews with missing/invalid ratings, I am down to 2595 reviews from 2615. I have 13 reviews missing Type, down from 24. I have 3 reviews missing Package, down from 8.

Design considerations

I want all the data provided in the sample dataset to be included in the database. As such, I assume all the rows in the sample dataset are valid i.e.

- ID need not be unique, but must not be empty or NULL
- [Country must be found in the ISO 3166-1](#)
- Type can be NULL, but must not be empty
- Package can be NULL, but must not be empty
- Rating must be between 0.0-5.0

Importantly, I decided to not use ID as the primary key and instead use the [unique rowid](#). This gave me the opportunity to use the ID as the "ID/token of the reviewer". When submitting reviews, the reviewer is asked to include an ID. If someone wants to modify/delete the review, he has to enter the correct ID.

(Note: some reviews imported from the sample dataset will have the same ID and rowid. If you think this defeats the purpose of using the ID as a secret token, you can uncomment line 38 of `init_db.py` "random.shuffle(to_db)", but when you want to delete any of them, you would have to manually search for their ID in `ramen-ratings.csv`
:laughing:)

Installation for Windows

Install [Python 3](#)

Enter the project directory, create a virtual env and enter it

```
cd ramen_ratings
py -m pip install --upgrade pip
py -m pip install --user virtualenv
py -m venv env
.\env\Scripts\activate
```

Install dependencies

```
py -m pip install -r requirements.txt
```

Running the server

```
python init_db.py
set FLASK_APP=app.py
set FLASK_ENVIRONMENT=development
flask run
```

On the use of curl and Postman

For the rest of this documentation, I will be demonstrating using Windows Command Prompt and Postman. The commands will work in Windows Powershell if [use curl.exe instead of curl](#) and [--% to stop parsing as powershell commands](#):

```
curl.exe --%
```

List all reviews

Endpoint: `http://127.0.0.1:5000/reviews`, HTTP Method: GET Since I am using ID as a token, I hide it when listing reviews and show rowid instead.

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews
```

On Postman

The screenshot shows the Postman interface with a GET request to `http://127.0.0.1:5000/reviews` sent successfully. The status is 200 OK, with a response time of 33 ms and a body size of 422.95 KB. The response body is displayed in JSON format, showing an array of 3 review objects. The first object has Brand A, Country IDN, Package Cup, Rating 5.0, Type Seaweed Instant Noodle, and rowid 1. The second object has Brand B, Country KOR, Package Cup, Rating 3.3, Type Beef Ramen, and rowid 2. The third object has Brand C.

```
[
  {
    "Brand": "Brand A",
    "Country": "IDN",
    "Package": "Cup",
    "Rating": 5.0,
    "Type": "Seaweed Instant Noodle",
    "rowid": 1
  },
  {
    "Brand": "Brand B",
    "Country": "KOR",
    "Package": "Cup",
    "Rating": 3.3,
    "Type": "Beef Ramen",
    "rowid": 2
  },
  {
    "Brand": "Brand C",
    "Country": "JPN",
    "Package": "Noodle",
    "Rating": 4.5,
    "Type": "Miso Ramen",
    "rowid": 3
  }
]
```

Create a new review

Endpoint: `http://127.0.0.1:5000/reviews` , HTTP Method: POST

ID, Country and Brand are required and cannot be empty. [Country must be found in the ISO 3166-1](#)

To create a review with the following values | ID | Country | Brand | Type | Package | Rating | | ----- | ----- | ----- | ----- | ----- | ----- | | 3000 | SGP | Brand A | Laksa | Cup | 4.9 |

On Postman, send POST to `http://127.0.0.1:5000/reviews` and use the following as Body input: `{"ID":"3000","Country":"SGP","Brand":"Brand A","Type":"Laksa","Package":"Cup","Rating":4.9}`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews -X POST -H "Content-Type: application/json" -d '{"ID":"3000", "Country": "SGP", "Brand": "Brand A", "Type": "Laksa", "Package": "Cup", "Rating": 4.9}'
```

```
C:\>curl -i http://127.0.0.1:5000/reviews -X POST -H "Content-Type: application/json" -d '{"ID":"3000", "Country": "SGP", "Brand": "Brand A", "Type": "Laksa", "Package": "Cup", "Rating": 4.9}'
HTTP/1.1 201 CREATED
Server: Werkzeug/2.1.2 Python/3.10.3
Date: Sat, 28 May 2022 12:30:36 GMT
Content-Type: application/json
Content-Length: 140

{
  "Brand": "Brand A",
  "Country": "SGP",
  "ID": "3000",
  "Package": "Cup",
  "Rating": 4.9,
  "Type": "Laksa",
  "rowid": 2616
}
```

Get specific review

Endpoint: `http://127.0.0.1:5000/reviews/<rowid>` , HTTP Method: GET

On Postman, send GET to `http://127.0.0.1:5000/reviews/1`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews/1
```

```
C:\>curl -i http://127.0.0.1:5000/reviews/1
HTTP/1.1 200 OK
Server: Werkzeug/2.1.2 Python/3.10.3
Date: Sat, 28 May 2022 12:20:01 GMT
Content-Type: application/json
Content-Length: 151
Connection: close

{
  "Brand": "Brand A",
  "Country": "IDN",
  "ID": "1",
  "Package": "Cup",
  "Rating": 5.0,
  "Type": "Seaweed Instant Noodle",
  "rowid": 1
}
```

Modify review

Endpoint: `http://127.0.0.1:5000/reviews/<rowid>`, HTTP Method: PUT or PATCH
ID must match the one used when review was created.

PUT (replaces all columns)

Country and Brand are required and cannot be empty. [Country must be found in the ISO 3166-1](#)

On Postman, send PUT to `http://127.0.0.1:5000/reviews/1` and use the following as Body input: `{"ID": "1", "Country": "SGP", "Brand": "Brand A", "Type": "Laksa", "Package": "Cup", "Rating": 4.9}`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews/1 -X PUT -H "Content-Type: application/json" -d
'{"ID": "1", "Country": "SGP", "Brand": "Brand A", "Type":
"Laksa", "Package": "Cup", "Rating": 4.9}'
```

```
C:\>curl -i http://127.0.0.1:5000/reviews/1 -X PUT -H "Content-Type: application/json" -d '{"ID":"1", "Country": "SGP", "Brand": "Brand A", "Type": "Laksa", "Package": "Cup", "Rating": "4.9"}'
HTTP/1.1 200 OK
Server: Werkzeug/2.1.2 Python/3.10.3
Date: Sat, 28 May 2022 12:34:46 GMT
Content-Type: application/json
Content-Length: 134
Connection: close

{
  "Brand": "Brand A",
  "Country": "SGP",
  "ID": "1",
  "Package": "Cup",
  "Rating": 4.9,
  "Type": "Laksa",
  "rowid": 1
}
```

PATCH (changes some columns)

Country and Brand are not required but cannot be empty. [Country must be found in the ISO 3166-1](#)

On Postman, send PATCH to `http://127.0.0.1:5000/reviews/1` and use the following as Body input: `{"ID": "1", "Rating": 4.8}`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews/1 -X PATCH -H "Content-Type: application/json" -d '{"ID":"1", "Rating": "4.8"}'
```

```
C:\>curl -i http://127.0.0.1:5000/reviews/1 -X PATCH -H "Content-Type: application/json" -d '{"ID":"1", "Rating": "4.8"}'
HTTP/1.1 200 OK
Server: Werkzeug/2.1.2 Python/3.10.3
Date: Sat, 28 May 2022 12:44:14 GMT
Content-Type: application/json
Content-Length: 134

  "rowid": 1
}
```

Delete review

Endpoint: `http://127.0.0.1:5000/reviews/<rowid>`, HTTP Method: DELETE
ID must match the one used when review was created.

On Postman, send DELETE to `http://127.0.0.1:5000/reviews/1` and use the following as Body input: `{"ID": "1"}`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews/1 -X DELETE -H "Content-Type: application/json" -d '{"ID":"1"}'
```

```
C:\>curl -i http://127.0.0.1:5000/reviews/1 -X DELETE -H "Content-Type: application/json" -d "{\"ID\":\"1\"}"
HTTP/1.1 200 OK

Date: Sat, 28 May 2022 14:22:50 GMT
Content-Type: application/json
Content-Length: 3
Connection: close

{}

```

Get a list of ramen reviews filtered by a country

Endpoint: `http://127.0.0.1:5000/reviews?country=<country>`, HTTP Method: GET

Restriction on Country value

When reviews are created, the Country value must be found in the ISO 3166-1, a standard defining codes for the names of countries.

For example, Singapore in the ISO 3166-1 is `Country(name='Singapore', alpha2='SG', alpha3='SGP', numeric='702')`. The name or codes are accepted and when filtered by country, any row with Country that matches name or code (no need to match case) will be shown.

- Accepted values: `SGP, sgp, sGp, Singapore, siNgapore, SG, sg, 702` etc
- Unaccepted/Wrong values: `Singapo, ingapore, s, gp`(points to Guadeloupe) etc

Notably, in the sample dataset, only Country "UK" does not match any of the countries in ISO 3166-1. That is because United Kingdom is `Country(name='United Kingdom of Great Britain and Northern Ireland', alpha2='GB', alpha3='GBR', numeric='826')`. I manually added UK as an acceptable value of the same country as GB.

On Postman, send GET to `http://127.0.0.1:5000/reviews?country=GB`

On Windows Command Prompt

```
curl -i http://127.0.0.1:5000/reviews?country=GB
```

```
C:\>curl -i http://127.0.0.1:5000/reviews?country=GB
HTTP/1.1 200 OK
Server: Werkzeug/2.1.2 Python/3.10.3
Date: Sat, 28 May 2022 13:50:46 GMT
